Decode HTML entities in Python string?

I'm trying to work out if there is a better way to achieve the following:

```
79 from lxml import html
from BeautifulSoup import BeautifulSoup

32 soup = BeautifulSoup("<p>&pound;682m</p>")
text = soup.find("p").string

print text
>>> &pound;682m

print html.fromstring(text).text
>>> £682m
```

So I'm trying to produce the same string that lxml returns when I do the second print. I'd rather not have to resort to lxml in order to interpret these escaped characters: can anyone provide a way of doing this with something in the standard library?

[edit: I've accepted luc's answer but both are valid: I just thought that the answer that made use of the standard library was probably more useful in a generic sense]

python html xml escaping

156 You can also use the Html parser from the standard lib see <http://docs.python.org/library/htmlparser.html>

```
>>> import HTMLParser
>>> h = HTMLParser.HTMLParser()
>>> print h.unescape('&pound;682m')
£682m
```
